Population Genetics Explorer

Individual Simulations

Here, you can generate one simulation for each group of settings you select. Use this to compare how different settings may affect allele and/or genotype frequencies.

Adjust the settings for the model below. Select “Reset Simulator” to restore the default settings.

Simulator Settings

? **Population Size**

10000

1 10000

Infinite (∞)

? **Generations**

10000

1 10000

? **Starting Frequency of Allele A_1**

0.500

0 1

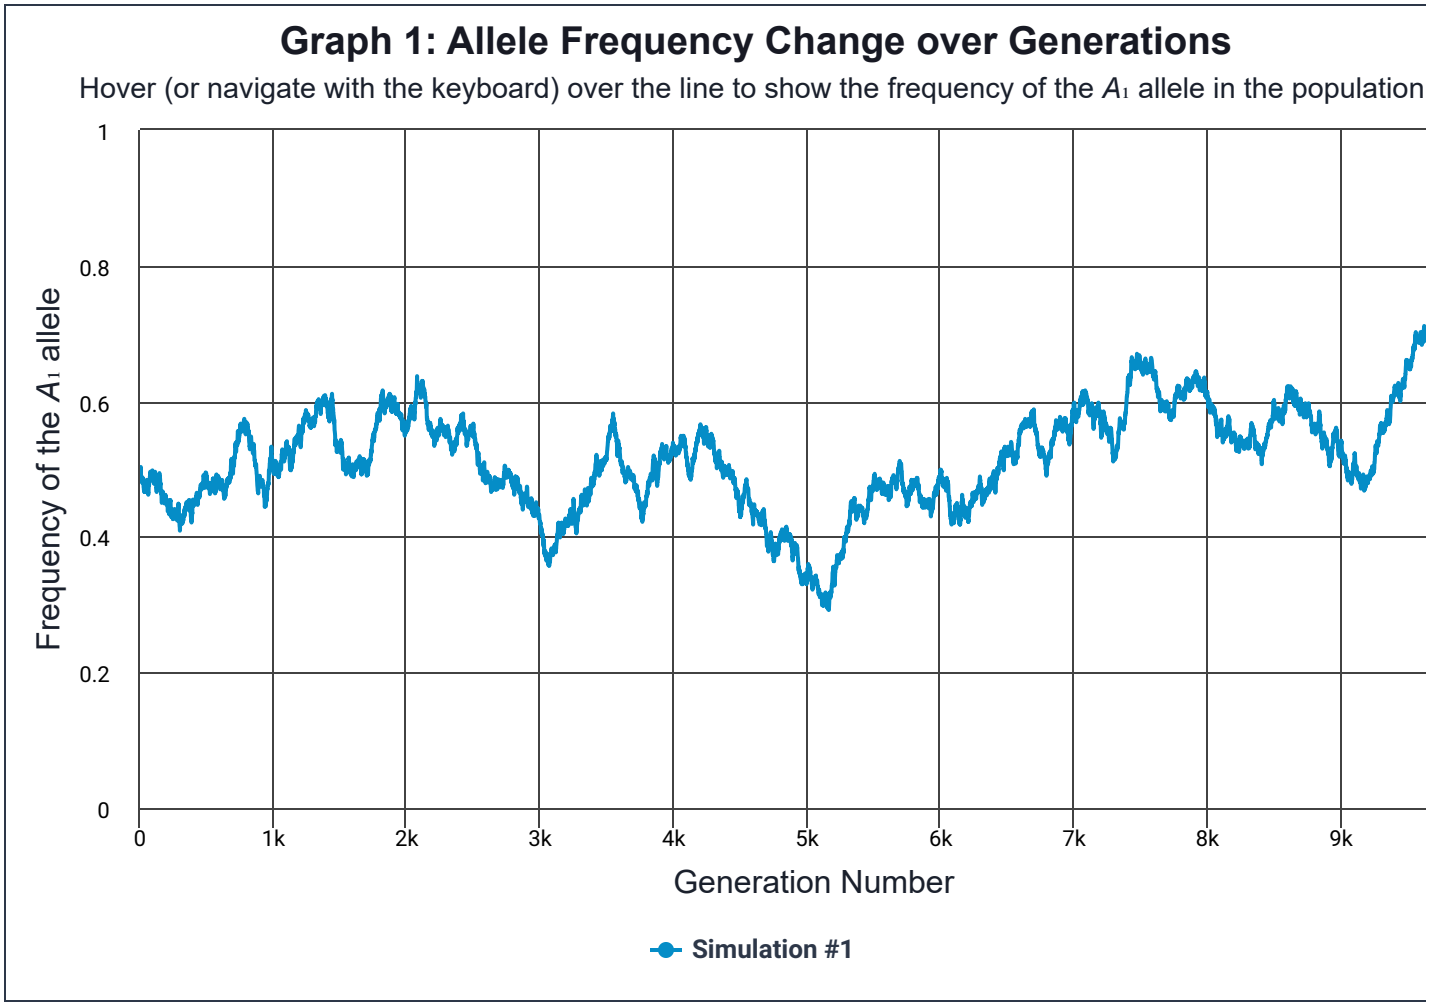
Additional Settings

Generate Shareable Link

You can change the settings above, then select “Run Simulation” to get a new simulation based on the latest settings. Select “Add a New Simulation” to add another simulation to the graph without erasing the last simulation.

Run Simulation

Add a New Simulation

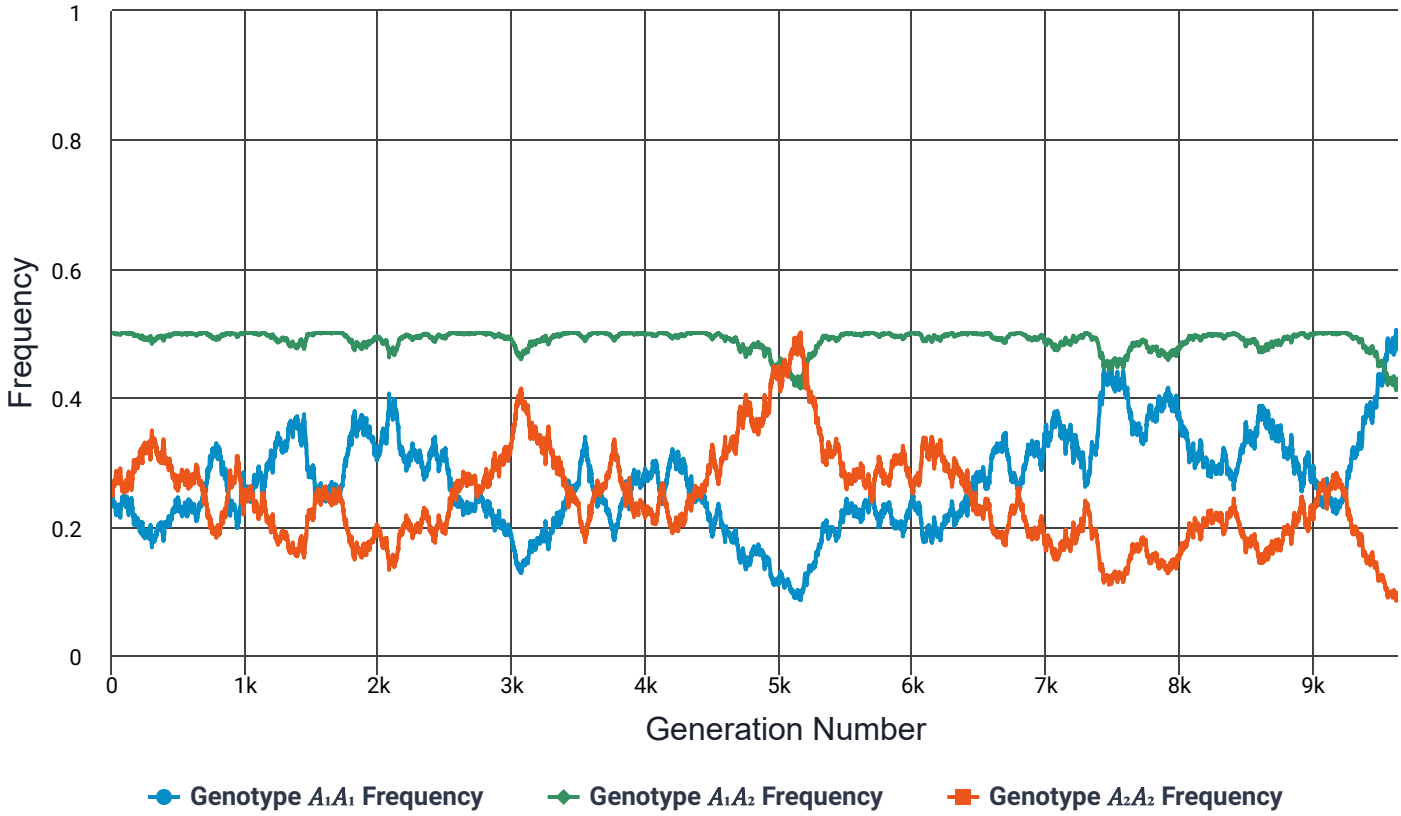


Select the bar below to show/hide the settings and statistics for the simulation(s).

Settings/Statistics for Graph 1

Graph 2: Genotype Frequency Change over Generations (Last Simulation)

Hover (or navigate with the keyboard) over a line to show the frequency of a specific genotype in the population.



Select the bar below to show/hide the starting and final genotype frequencies for A_1A_1, A_1A_2, and A_2A_2. Only the results from the last simulation are provided.

Genotype Statistics (Last Simulation)
